# Chapter 1: What's new in Deployment Center 3.1

## Streamlined client and environment deployment

### Install or upgrade Deployment Center using an input configuration file

You now provide an input file for Deployment Center installation parameters. The input file offers new support for specifying multiple repository locations.

The command line arguments for installing and upgrading Deployment Center are deprecated in this release. Please migrate to using the new input file.

### Manage the repository more easily

Several improvements for managing repositories include:

- Specifying multiple repository locations during Deployment Center installation or upgrade using the **extraSoftwareDir** parameter.
- Adding and removing repository locations after Deployment Center has been installed or upgraded.
- Using mapped drives to network locations in repository paths.
- Removing obsolete software that exists in repositories but is not used in registered environments.
- Warnings about invalid files in the repositories.
- Performance improvements in scanning the repositories for software.

### Deploy Teamcenter clients on user machines

Deployment Center now offers a way to perform mass installations and updates for Teamcenter client software, such as rich client, across multiple user machines using a single deployment script. The Deployment Center can now produce client installation and upgrade scripts that work on any number of user machines.
