# Chapter 1: What's New in Rapid Start 11.6

## New workflow handlers

- Generate a PDF file from CGM and MS Office files

The user will now be able to convert CGM and MS Office files to PDF. The user can use this functionality if they wish to send out uneditable documents for review. Once initiated on an Item Revision, the **TCRS-generate-pdf** workflow generates a PDF file of the specified dataset, which is attached to the Item Revision. The generated PDF will be attached back to the Item Revision.

Prerequisites:

- o The system administrator must configure the **TCRS-generate-pdf** workflow handler in the Rapid Start environment.
- o A PDF generation third party software or script must be installed on the server.
- Save a snapshot of an item revision  
The development release process in Rapid Start follows an approval process. Using the preconfigured **0-user snapshot** workflow, the user will now be able to release an object quickly without having to follow the approval process. Initiating this workflow allows the user to save a snapshot of the object's design or item revision before making any further modifications.
- Revert release status of object  
The preconfigured **unrelease-60** workflow handler will help you unrelease status-60 from any target object. For example, if you have released an object with status 60 but would like to update it or make changes to it, then you can revert its status to **unrelease-60** and update it before it is released for production.
- Export BOM assembly data in XML format  
The preconfigured **TCRS-bom-plmxml-export** workflow handler will now let the user export BOM data to an XML file format.
